Excel Data Analysis Project

Sales Data Analysis using Excel formulas and PivotTables

1. Project Objective

The objective of this project is to analyze a structured sales dataset using Microsoft Excel. The analysis uses formulas, sorting and filtering, PivotTables, and summary KPIs to understand sales performance across regions, product categories, and dates.

2. Tools and Techniques

Tools: Microsoft Excel (Google Sheets can also be used). Techniques: data checking and cleaning, calculated Sales and Profit columns, SUM/COUNTA-style summary formulas, PivotTables, and sales summaries by region, category, and date.

3. Main Analysis

Analysis	Purpose
Sales by Region	Compare sales performance between regions.
Sales by Category	Identify categories contributing the most sales.
Region vs. Category	Compare category performance within each region.
Monthly Sales Trend	Review sales over time and identify trends.
Summary KPIs	Provide a quick view of total sales, orders, quantity, and profit.

4. Key Findings

The current PivotTable output reports total sales of 217,950. In the supplied figures, the West region is reported as the highest-sales region at 92,900, and Electronics is reported as the leading category at 181,300. These results should be treated as provisional until the source dates and PivotTables are cleaned and refreshed, because the Monthly Sales PivotTable also contains text-like entries such as “Formula2” and “dc”, and a blank date row. After correcting the source data, refresh the PivotTables and confirm that the totals remain the same before final submission.

5. Conclusion

Excel formulas and PivotTables make it easier to summarize sales data and compare performance across regions, categories, and dates. The project is suitable as a beginner-level Excel data-analysis portfolio project. Before publishing, standardize the Order Date column, verify calculated Sales and Profit values, refresh the PivotTables, and ensure the Summary KPIs match the cleaned data.

Final validation note

This report is intentionally concise and includes only the main submission points. The figures above are taken from the project details shared so far; verify them against the corrected workbook before treating them as final results.
